

- 1 -

INDAZOLES HAVING ANALGESIC ACTIVITY

DESCRIPTION

5 The present invention relates to an indazole having analgesic activity, a method for the preparation thereof and a pharmaceutical composition containing the same.

Chronic pain is very widespread. On average about 20% of the adult population suffers from it, and it is generally associated with clinical
10 conditions characterized by chronic and/or degenerative lesions.

Typical examples of pathologies characterized by chronic pain are rheumatoid arthritis, osteoarthritis, fibromyalgia, neuropathies, etc. [Ashburn MA, Staats PS. Management of chronic pain. Lancet 1999; 353: 1865-69].

15 Chronic pain is often debilitating and is the cause of loss of the capacity for work and poor quality of life. Therefore it also has adverse economic and social consequences.

The analgesic drugs currently used in the treatment of chronic pain belong basically to two classes: the non-steroidal anti-inflammatory drugs (NSAIDs), which combine analgesic activity and anti-inflammatory activity, and the opioid analgesics. These classes constitute the basis for the three-step "analgesic scale" suggested by the World Health Organization for drug treatment of pain [Textbook of Pain. 4th edition. PD Wall and R Melzack Eds. Churchill Livingstone,
20 1999].

Chronic pain is notoriously difficult to treat using the treatments currently available. Consequently the development of new analgesics has always been one of the main aims of the pharmaceutical industry. Nevertheless, despite the extensive research efforts directed towards
25 identifying a suitable analgesic compound, there is a significant number
30

- 2 -

of patients whose pain condition is still not being adequately treated [Scholz J, Woolf CJ. Can we conquer pain? Nat Neurosci. 2002; 5: 1062-76].

Surprisingly, it has now been found that such properties are
5 possessed by a new family of indazoles.

In its first aspect, the present invention thus relates to an indazole of general formula:

where

- 10 X is C(O)NHCH₂, NHC(O) or NHC(O)CH₂;
 R_a is H, NH₂C(O), CH₃C(O)NH, CH₃SO₂, CH₃SO₂NH, linear or branched C₁-C₃ alkyl, linear or branched C₁-C₃ alkoxy, or halogen;
 R_b is H, linear or branched C₁-C₆ alkyl; aryl-(C₁-C₃)alkyl optionally substituted with 1 or 2 halogen atoms, with a C₁-C₃ alkyl group or
 15 a C₁-C₃ alkoxy group;

and in which

a) when X is C(O)NHCH₂

- R_c is hydroxy, amino, di-(C₁-C₃)alkyl-amino, tri-(C₁-C₃)alkyl-ammoniomethyl, nitro, trifluoromethyl, nitrile, CH₃C(O)NH, CH₃SO₂NH, CH₃SO₂, R'R''NSO₂, where R' and R'' are H, or a linear or branched C₁-C₆ alkyl ,
 20 R_d is H, hydroxy, amino, di-(C₁-C₃)alkyl-amino, tri-(C₁-C₃)alkyl-ammoniomethyl, nitro, trifluoromethyl, nitrile, CH₃C(O)NH, CH₃SO₂NH, CH₃SO₂, R'R''NSO₂, where R' and R'' have the
 25 meanings stated above,

- 3 -

with the proviso, however, that when R_a and R_d are both H, and R_b is isopropyl, then R_c is not hydroxy;

b) when X is NHC(O) or NHC(O)CH_2

R_c and R_d , which may be equal or different, are H, hydroxy, $\text{C}_1\text{-C}_3$ alkoxy, halogen, amino, di- $(\text{C}_1\text{-C}_3)$ alkylamino, tri- $(\text{C}_1\text{-C}_3)$ alkyl-ammoniomethyl, nitro, trifluoromethyl, nitrile, $\text{CH}_3\text{C(O)NH}$, $\text{CH}_3\text{SO}_2\text{NH}$, CH_3SO_2 , $\text{R}'\text{R}''\text{NSO}_2$, where R' and R'' have the meanings stated above,

and their acid addition salts with pharmaceutically acceptable organic and inorganic acids.

Typical examples of pharmaceutically acceptable acids are: oxalic, maleic, methanesulphonic, paratoluenesulphonic, succinic, citric, tartaric, lactic, hydrochloric, phosphoric, sulphuric.

Preferred meanings of R_a are H and $\text{C}_1\text{-C}_3$ alkyl.

Preferred meanings of R_b are H and $\text{C}_1\text{-C}_3$ alkyl.

Preferred meanings of R_c are H, NO_2 , NH_2 , OH and $\text{C}_1\text{-C}_3$ alkoxy.

The preferred meaning of R_d is H.

The analgesic activity of the compounds of formula (I) was found by means of two experimental models in the rat: mechanical hyperalgesia induced by CFA and mechanical hyperalgesia in diabetic neuropathy induced by streptozocin.

As is known to a person skilled in the art, the aforementioned experimental models can be regarded as predictive of activity in man.

CFA-induced hyperalgesia is a syndrome characterized by the activation of circuits with the task of controlling the inflammatory response and associated with the appearance of conditions that interfere with the perception of pain. Injection of CFA is in fact capable of peripherally inducing the release of specific substances (mediators of the inflammatory response and algogenic agents) responsible for local damage and centrally, at the level of the spinal cord, determining

- 4 -

biochemical changes that support the amplification of the perception of pain. As is well known, this model constitutes a valid tool for investigating drugs for use in the treatment of inflammatory pain in man and, in particular, in the control of conditions such as hyperalgesia and allodynia.

Typical examples of human pathologies characterized by this type of pain associated with degenerative inflammatory processes are rheumatoid arthritis and osteoarthritis.

In its turn, the diabetic neuropathy induced by streptozocin in the rat represents an insulin-dependent syndrome characterized by a concomitant decrease in the conduction velocity of the motor and sensory nerves and the appearance of a number of anomalies in pain perception. As is well known, this experimental model constitutes a useful tool for the investigation of drugs for use in the treatment of neuropathic pain in man. In particular, the model represents a valid example of a whole host of neuropathic pains characterized by phenomena such as hyperalgesia and allodynia following primary lesions or dysfunctions of the nervous system. Typical examples of human pathologies characterized by dysfunctions of this type and by the presence of neuropathic pain are diabetes, cancer, immunodeficiency diseases, trauma, ischaemias, multiple sclerosis, sciatic neuralgias, neuralgia of the trigeminal nerve and post-herpetic syndromes.

In a second aspect, the present invention relates to a method of preparation of a compound of formula (I) in which $X = C(O)NHCH_2$ and acid addition salts thereof with pharmaceutically acceptable organic or inorganic acids, characterized in that it comprises the following stages:

a) reaction of an amine of formula (II)

- 5 -

(II)

where

- R_c and R_d have the same meanings as stated above or, when R_c or R_d is an amino or alcoholic group, R_c and R_d may be an amino or alcoholic group protected by a protective group of conventional type, with a derivative of an indazole-carboxylic acid of formula (IIIa)

(IIIa)

where

- R_a and R_b have the meanings stated above, and Y is a Cl or Br atom, or an OR or OC(O)R group, where R is a linear or branched alkyl having from 1 to 6 carbon atoms, or with a derivative of an indazole-carboxylic acid of formula (IIIb)

(IIIb)

where

- R_a has the meanings stated above,

- 6 -

b) cleavage of any possible protective group of the aforesaid amino or alcoholic group, and

c) optional formation of an acid addition salt of the indazoleamide of formula (I) with a pharmaceutically acceptable organic or inorganic acid.

5

In a third aspect, the present invention relates to a method of preparation of a compound of formula (I) in which $X = \text{NH}(\text{CO})$ or $\text{NH}(\text{CO})\text{CH}_2$ and acid addition salts thereof with pharmaceutically acceptable organic or inorganic acids, characterized in that it comprises

10 the following stages:

a') reaction of an amine of formula (IV)

(IV)

where

R_a and R_b have the meanings stated above,

15 is condensed with a derivative of a carboxylic acid of formula (V)

(V)

where

R_c and R_d have the same meanings as stated above or, when R_c or R_d is an amino or alcoholic group, R_c and R_d may be an amino or alcoholic

20 group protected by a protective group of conventional type, and

- 7 -

Z is a group C(O)Y or CH₂C(O)Y in which Y is a Cl or Br atom, or an OR or OC(O)R group, where R is a linear or branched alkyl having from 1 to 6 carbon atoms,

- b') cleavage of any possible protective group of the aforesaid amino or
5 alcoholic group, and
c') optional formation of an acid addition salt of the indazoleamide of formula (I) with a pharmaceutically acceptable organic or inorganic acid.

A person skilled in the art will easily understand that some
10 compounds of formula (I) can also be prepared from another compound of formula (I) by conventional techniques. For example, when R_c and/or R_d are an NO₂ group the latter can be reduced to give the corresponding compound of formula (I) in which R_c and/or R_d are NH₂.

The amine of formula (II) may be obtained according to conventional
15 methods. For example, by alkylation of isonipecotamide with a suitable halide and then reduction of the amide to primary amine (WO 9807728) or by protection of aminomethylpiperidine with benzaldehyde (Synthetic Communications 22(16), 2357-2360, 1992), alkylation with a suitable halide and deprotection.

20 The intermediate of formula (II) in which R_c and R_d have the meanings stated above is novel. This intermediate therefore is another aspect of the present invention.

The compounds of formula (IIIa) and (IIIb) may also be obtained according to conventional methods. For example, the compounds of
25 formula (IIIa) in which Y is chlorine may be obtained from the corresponding acid with thionyl chloride (J. Med. Chem., 1976, Vol. 19 (6), pages 778-783), whereas the compounds of formula (IIIa) in which Y is OR or OC(O)R may be obtained by means of known reactions of esterification or of formation of mixed anhydrides (R.C. Larok,
30 Comprehensive Organic Transformations, VCH, pages 965-966). In

- 8 -

their turn, the compounds of formula (IIIb) may be obtained according to J.O.C. 1958, Vol. 23 page 621.

In their turn the compounds of formula (IV) may be obtained according to the conventional methods described in the literature, for example in J. of Heterocyclic Chemistry 1979 (16) 783-784, or in
5 J.A.C.S., 1943 (65) 1804-1806.

The compounds of formula (V) may also be obtained according to conventional methods. For example, the compounds of formula (V) in which Y is chlorine may be obtained by saponification of the
10 corresponding esters followed by treatment with thionyl chloride.

Preferably, stages (a) and (a') are carried out by reacting

- a compound of formula (II) with a compound of formula (IIIa) in which Y is chlorine, or
- a compound of formula (II) with a compound of formula (IIIb), or
- 15 - a compound of formula (IV) with a compound of formula (V) in which Y is chlorine,

in the presence of a suitable diluent and at a temperature of from 0 to 140°C, for a time of from 0.5 to 20 hours.

Preferably, the reaction temperature is of from 15 to 40°C.
20 Advantageously, the reaction time is of from 1 to 18 hours.

Preferably the diluent is aprotic, polar or nonpolar. Even more preferably it is aprotic nonpolar. Examples of suitable aprotic nonpolar diluents are the aromatic hydrocarbons, e.g. toluene. Examples of suitable aprotic polar diluents are dimethylformamide and
25 dimethylsulphoxide.

In the embodiments in which a compound of formula (II) is reacted with a compound of formula (IIIa) in which Y is chlorine, or in which a compound of formula (IV) is reacted with a compound of formula (V) in which Y is chlorine, the aforesaid stages (a) and, respectively, (a') are

- 9 -

preferably carried out in the presence of an organic or inorganic acceptor of acids.

Examples of suitable organic acceptors of acids are pyridine, triethylamine and the like. Examples of suitable inorganic acceptors of acids are alkali carbonates and bicarbonates.

In stages (b) and (b'), cleavage of the protective group of the amino or alcoholic group is preferably carried out by techniques known in the chemistry of protective groups.

In their turn, stages (c) and (c') are preferably preceded by a stage of isolation of the indazoleamide of formula (I).

In a further aspect, the present invention relates to a pharmaceutical composition containing an effective amount of a compound of formula (I), or of an addition salt thereof with a pharmaceutically acceptable acid, and at least one pharmaceutically acceptable inert ingredient.

A typical example of a pathologic state that might benefit from treatment with a pharmaceutical composition according to the present invention is chronic pain. Typically this chronic pain is due to chronic lesions or to degenerative processes such as rheumatoid arthritis, osteoarthritis, fibromyalgia, oncologic pain, neuropathic pain and the like.

Preferably, the pharmaceutical compositions of the present invention are prepared in a suitable dosage form.

Examples of suitable dosage forms are tablets, capsules, coated tablets, granules, solutions and syrups for oral administration; creams, ointments and medicated patches for topic administration; suppositories for rectal administration and sterile solutions for injectable, aerosol or ophthalmic administration.

Advantageously, these dosage forms will be formulated in such a way as to provide controlled release over time of the compound of formula (I) or of a salt thereof with a pharmaceutically acceptable acid.

- 10 -

Indeed, depending on the type of treatment, the required time of release may be very short, normal or protracted.

The dosage forms may also contain other conventional ingredients such as: preservatives, stabilizers, surfactants, buffers, salts for the
5 regulation of the osmotic pressure, emulsifiers, sweetener agents, coloring agents, flavouring agents and the like.

Moreover, when required by particular therapies, the pharmaceutical composition of the present invention may contain other pharmacologically active ingredients whose concomitant is
10 therapeutically useful.

The amount of the compound of formula (I) or of the pharmaceutically acceptable acid salt thereof in the pharmaceutical composition of the present invention may vary in a wide range depending on known factors, such as for example the type of disease to
15 be treated, the severity of the disease, the patient's body weight, the dosage form, the chosen route of administration, the number of daily administrations and the efficacy of the chosen compound of formula (I). However, the optimum amount may be easily and routinely determined by a person skilled in the art.

20 Typically, the amount of the compound of formula (I) or of a salt thereof with a pharmaceutically acceptable acid in the pharmaceutical composition of the present invention will be such that it ensures an administration level of from 0.001 to 100 mg/kg/day. Even more preferably, of from 0.1 to 10 mg/kg/day.

25 The dosage forms of the pharmaceutical composition of the present invention can be prepared according to techniques that are well known to the pharmaceutical chemist and comprise mixing, granulation, compression, dissolution, sterilization and the like.

The following examples will illustrate the invention, without limiting it
30 in any way.

- 11 -

In the following examples, the substituents on the aromatic ring (R_c and R_d) are indicated with numbering in bold.

EXAMPLE 1

5 (N(((1-(2-(4-nitrophenyl)ethyl)-4-piperidiny)methyl)-1H-indazole-3-carboxamide hydrochloride (AF3R298)

(I, $R_a = R_b = R_d = H$; $R_c = 4\text{-NO}_2$; $X = C(O)NHCH_2$)

a) N-hexahydro-4-pyridinylmethyl-N-phenylmethyldene-amine

Benzaldehyde (4.6 g; 0.044 mol) was added dropwise to a solution of 4-aminomethylpiperidine (5.0 g; 0.044 mol) in toluene (20 ml). The
10 solution thus obtained was stirred for 3 h at room temperature. Then the solvent was removed by evaporation at reduced pressure and the residue was taken up twice with toluene to give the desired product that was used as such without further purification.

b) 1-(2-(4-nitrophenyl)ethyl)-4-piperidinylmethane-amine

15 The product of Example 1a) (8.8 g; 0.044 mol) was dissolved in absolute ethanol (50 ml) and added to a suspension containing 2-(4-nitrophenyl)ethylbromide (10.0 g; 0.044 mol) and anhydrous potassium carbonate (12.1 g; 0.088 mol) in absolute ethanol (100 ml). The suspension thus obtained was boiled under reflux for 16 hours. The
20 reaction mixture was then left to cool to room temperature and filtered. The filtrate was evaporated at reduced pressure. The residue thus obtained was then suspended in 3N HCl (50 ml) and stirred for 3 h at room temperature. The solution was then transferred to a separatory funnel and the acid aqueous phase was washed with ethyl acetate (4 x
25 50 ml), the aqueous phase was then made alkaline by addition of 6N NaOH and extracted with dichloromethane. The organic phase was dried over $NaSO_4$ and the solvent was removed by evaporation at reduced pressure to give the desired product (9 g).

- 12 -

¹H-NMR (δ, CDCl₃ + D₂O): 1.43-1.50 (m, 3H); 1.76 (d J=12 Hz, 2H); 2.03 (t, J=12 Hz, 2H); 2.67-2.52 (m, 4H); 2.82-3.06 (m, 4H); 7.39 (d, J=9 Hz, 2H); 8.12 (d, J=9 Hz, 2H); 7.95 (quintet, J=1 Hz, 1H).

5 c) N((1-(2-(4-nitrophenyl)ethyl)-4-piperidinyl)methyl)-1H-indazole-3-carboxamide hydrochloride

A solution of the product of Example 1b) (8.4 g; 0.032 mol) in toluene (85 ml) was added, using a dropping funnel, to a suspension containing 7H,14H-indazole(2',3':4,5)pyrazine(1,2-b)indazole-7,14,dione (4.6 g; 0.016 mol) prepared as described in J.O.C., 1958, Vol. 23, page 621, in
10 toluene (60 ml). The reaction mixture was stirred at room temperature for 38 hours and then filtered. The solid was separated and added to a stirred saturate solution of NaHCO₃ (200 ml) for 2 h. The reaction mixture was filtered and the thus obtained solid product was converted into the corresponding hydrochloride by dissolution in absolute ethanol,
15 addition of hydrogen chloride in ethanol and recrystallization from ethanol, to give the desired product (4.2 g).

a) 1-(2-(4-methoxyphenyl)ethyl)-4-piperidine-carboxylic acid

20 hydrochloride

The title product was obtained (15.8 g) by working in a similar way to that described in Example 5a) but starting from 1-(2-(4-methoxyphenyl)ethyl)-4-carboxypiperidine (16.5 g; 0.057 mol), prepared as described in US 6 017 931, instead of from 1-(2-phenylethyl)-4-carboxypiperidine.

25

¹H-NMR (δ, DMSO): 1.80-2.17 (m, 4H); 2.41-3.74 (m, 7H); 3.73- (s, 3H); 6.89 (d, J=9 Hz, 2H); 7.19 (d, J=9 Hz, 2H) 11.00 (s broad, 1H); 12.53 (s broad, 1H)

- 17 -

b) 1-(2-(4-methoxyphenyl)ethyl)-4-piperidinecarbonyl chloride hydrochloride

The title product was obtained (14.2 g) starting from the product of Example 6a) (13.8 g; 0.048) and by working in a similar way to that described in example 5b). The product thus obtained was used as such without further purification.

c) N-(1-methyl-1H-indazol-3-yl)-1-(4-methoxyphenyl)ethyl)piperidine-4-carboxamide hydrochloride

The title product was obtained (9.2 g) starting from the product of Example 6b) (14.2 g; 0.045 mol) and from 1-methyl-1H-3-indazoleamine (6.6 g; 0.045 mol) and by working in a way similar to that described in Example 5c). A mixture of ethyl acetate:ethanol 9:1 was used as the crystallization solvent.

m.p.: 137-139°C (decomp.)

EXAMPLE 7

N-(1-methyl-1H-indazol-3-yl)-1-2-4-hydroxyphenyl)ethyl)piperidine-4-carboxamide hydrochloride (AF3R330)

(I, $R_a = R_d = H$, $R_b = CH_3$, $R_c = 4-OH$, $X = NHC(O)$)

A solution of the product of Example 6c) (6.7 g; 0.017 mol) in dichloromethane (300 ml) was added dropwise to a solution of BBr_3 (8.5 g; 0.034 mol) in dichloromethane (50 ml). The reaction mixture was stirred at room temperature for 6 h. Then water was added carefully and

- 18 -

the mixture was made alkaline with 1N NaOH to pH = 9 and transferred to a separatory funnel. The organic phase was separated, dried over Na₂SO₄, and the solvent was removed by evaporation at reduced pressure. The residue thus obtained (4.4 g) was purified by flash chromatography using a mixture CHCl₃:MeOH = 9:1 as eluent. 3 g of product were thus obtained, and were transformed into the corresponding hydrochloride by dissolution in ethanol, addition of hydrogen chloride in ethanol, evaporation of the solvent and crystallization from a mixture of ethyl acetate:ethanol 9:1, to give the desired product (2.8 g).

EXAMPLE 8

N((1-(2-(4-hydroxyphenyl)ethyl)-4-piperidiny)methyl)-5-methyl-1-(1-methylethyl)-1H-indazole-3-carboxamide hydrochloride (AF3R296)

(I, R_a = CH₃, R_b = i-C₃H₇, R_c = 4-OH, R_d = H, X = C(O)NHCH₂)

a) 1-(2-(4-hydroxyphenyl)ethyl)-4-piperidinylmethane-amine

The title product was obtained (9.3 g) by working in a similar way to that described in Example 1b) but starting from the product of Example 1a) (7.5 g, 0.037 mol) and 2-(4-hydroxyphenyl)ethyl bromide (7.5 g; 0.037 mol), prepared as described in Acta Chemica Scandinavica (1947-1973) 1967, 21 (1), 52-62, instead of from 2-(4-nitrophenyl)ethyl bromide.

- 19 -

¹H-NMR (δ, CDCl₃ + D₂O): 1.15-1.41 (m, 3H); 1.74 (d, J=9 Hz, 2H); 1.90-2.07 (m, 2H); 2.45-2.61 (m, 4H); 2.65-2.75 (m, 2H); 3.01 (d, J=12 Hz, 2H); 6.75 (d, J=9 Hz, 2H); 7.00 (d, J=9 Hz, 2H).

b) isopropyl ester of 1-(1-methylethyl)-5-methyl-1H-indazole-3-

5 carboxylic acid

A 60% suspension of sodium iodide in mineral oil (17.1 g; 0.43 mol) was added to a suspension of 5-methyl-1H-indazole-3-carboxylic acid (30 g; 0.17 mol) prepared as described in J. Heterocyclic Chem. 1964, Vol. 1 (5) 239-241, in dimethylformamide (450 ml), and the reaction
10 mixture was heated to 70°C. After 30 minutes, isopropyl bromide (48 ml, 0.51 mol) was added.

The reaction mixture was stirred for 6 hours at 70°C. After cooling, water was added. The reaction mixture was transferred to a separatory funnel and extracted with diethyl ether. The organic phase was washed
15 with water saturate with sodium bicarbonate and, finally, the solvent was removed by evaporation at reduced pressure.

In this way 20 g of an oil were obtained, which were purified by flash chromatography, eluting with a mixture hexane:ethyl acetate = 7:3, to give 12 g of the desired product.

20 ¹H-NMR (δ, CDCl₃): 1.47 (d, J=6 Hz, 6H); 1.64 (d, J=7 Hz, 6H); 2.50 (d, J=1 Hz, 3H); 4.92 (heptet, J=7 Hz, 1H); 5.39 (heptet, J=6 Hz, 1H); 7.23 (dd, J=9;1 Hz, 1H); 7.40 (d, J=9 Hz, 1H); 7.95 (quintet, J=1 Hz, 1H).

c) 1-(1-methylethyl)-5-methyl-1H-indazole-3-carboxylic acid

A suspension of the product prepared according to Example 8b) (8 g; 0.03 mol) in 1M NaOH (42 ml) was heated under reflux for 3 hours. It
25 was then poured into water, acidified with 2M HCl and extracted with dichloromethane. After evaporation of the solvent at reduced pressure, 7 g of the desired product were obtained.

- 20 -

$^1\text{H-NMR}$ (δ , CDCl_3): 1.61 (d, $J=7$ Hz, 6H); 2.44 (s, 3H); 4.88 (heptet, $J=7$ Hz, 1H); 7.19 (d, $J=9$ Hz, 1H); 7.34 (d, $J=9$ Hz, 1H); 7.97 (s, 1H); 9.32 (s broad, 1H).

d) chloride of 1-(1-methylethyl)-5-methyl-1H-indazole-3-carboxylic acid

5 Thionyl chloride (6.78 g; 0.057 mol) was added to a suspension of the product prepared according to Example 8c) (4.01 g; 0.019 mol) in toluene (70 ml), and the reaction mixture was heated under reflux for 2 hours. The solvent was removed by evaporation at reduced pressure and taken up twice with toluene (50 ml x 2) to give the desired product
10 (4.3 g) which was used as such without further purification.

e) N((1-(2-(4-hydroxyphenyl)ethyl)-4-piperidiny)methyl)-5-methyl-1-(1-methylethyl)-1H-indazole-3-carboxamide hydrochloride

Working in a similar way to that described in Example 3 but using the product of Example 8a) (4.0 g, 0.017 mol) and the chloride of 1-(1-methylethyl)-5-methyl-1H-indazole-3-carboxylic acid (4.0 g, 0.017 mol),
15 prepared as described in the preceding Example 8d), 4.5 g of the desired product were obtained, and this were transformed into the corresponding hydrochloride by dissolution in absolute ethanol, addition of hydrogen chloride in ethanol and recrystallization from ethanol to give
20 the desired salt (3.2 g).

TESTS

1. Mechanical hyperalgesia induced by CFA in the rat

Male CD rats weighing 150-200 g on arrival were used. Using an analgesiometer, rats were selected having a response threshold to a
5 mechanical nociceptive stimulus of from 150 to 180 g. By applying a gradual increase in pressure on the dorsal zone of the rat's left hind foot, the instrument makes it possible to record the nocifensive response, expressed in grams, corresponding to the moment when the animal retracts its foot [Randall LO and Semite JJ. A method for the
10 measurement of analgesic activity on inflamed tissue. Arch. Int. Pharmacodyn. Ther. 1957; 111: 409-419].

Hyperalgesia was induced by unilateral injection of 150 μ l of Complete Freund's Adjuvant (CFA) in the plantar surface of the animal's left hind foot [Andrew D, Greenspan JD. Mechanical and heat
15 sensitization of cutaneous nociceptors after peripheral inflammation in the rat. J Neurophysiol 1999; 82(5): 2649-2656; Hargreaves K, Dubner R, Brown R, Flores C, Joris J. A new and sensitive method for measuring thermal nociception in cutaneous hyperalgesia. Pain 1988;
32: 77-88].

20 The compounds under examination were tested (dose 10^{-5} mol/kg) by carrying out the test 23 hours after injection of CFA.

At 1 h following the treatment, the pain threshold measured in control animals was compared with that measured in animals treated with the product under examination. The control animals were treated with the
25 same vehicle (water) used for administering the products under examination. The results are shown in Table 1.

Table 1 – Effect on CFA

Treatment	Number of rats	Pain threshold (g) 1 h after treatment
Vehicle	12	121 \pm 4.1
AF3R294	12	194 \pm 22.4

- 22 -

AF3R296	12	151 ± 10.7
AF3R298	12	174 ± 9.8
AF3R302	12	160 ± 10.2
AF3R306	12	186 ± 11.0
AF3R328	12	150 ± 8.7
AF3R330	12	161 ± 10.5
AF3R334	12	170 ± 11.0

The pain threshold of normal animals of equal weight/age = 155 ± 2.1 g

2. Mechanical hyperalgesia in rats with diabetes induced by streptozotocin

Male CD rats weighing 240-300 g on arrival were used.

- 5 Diabetic syndrome was induced by a single intraperitoneal (i.p.) injection of 80 mg/kg of streptozotocin dissolved in sterile physiological solution [Courteix C, Eschali r A, Lavarenne J. Streptozotocin-induced diabetic rats: behavioural evidence for a model of chronic pain. Pain, 1993; 53: 81-88; Bannon AW, Decker MW, Kim Dj, Campbell JE, 10 Americ SP. ABT-594, a novel cholinergic channel modulator, is efficacious in nerve ligation and diabetic neuropathy models of neuropathic pain. Brain Res. 1998; 801: 158-63].

- After at least three weeks following the injection of streptozotocin, rats were selected having a level of glycaemia ≥ 300 mg/dl and having 15 a response threshold to a mechanical nociceptive stimulus ≤ 120 g. The glycaemia levels were measured by means of a reflectometer using reactive strips impregnated with glucose oxidase. The pain threshold was measured using an analgesiometer. By applying a gradual increase in pressure on the dorsal zone of the rat's left hind foot, the 20 instrument makes it possible to record the nocifensive response, expressed in grams, corresponding to the moment when the animal retracts its foot.

- 23 -

At 2 h following the treatment, the pain threshold measured in control animals was compared with that measured in animals treated with the product under examination (dose 10^{-5} mol/kg).

The control animals were treated with the same vehicle (water) used
5 for administering the products under examination. The results are shown in Table 2. Table 2 – Effect on diabetic neuropathy

Treatment	Number of rats	Pain threshold (g) 2 h after treatment
Vehicle	8	112 ± 4.0
AF3R294	8	198 ± 18.6
AF3R296	8	154 ± 8.7
AF3R298	8	170 ± 10.2
AF3R302	8	164 ± 10.2
AF3R306	8	184 ± 13.8
AF3R328	8	158 ± 6.2
AF3R330	8	171 ± 9.6
AF3R334	8	184 ± 10.5

The pain threshold of normal animals of equal weight/age = 240 ± 8.7 g
